Week 3 cone pusher preparation

Attach the team pusher and guide the cone during the robot dance

Print

[ ] 5 team sheets + 4 build cards + 1 attendance sheet = 10 required pages. Reuse role cards/hub guides; this checklist and lead notes are optional.

Pack and match the mounts

[ ] Reusable kit: 2 assembled robots, 4 laptops/chargers, tested cables, 14 pencils/erasers, 4 rulers, 4 team trays and 2 timers.

[ ] 6 matching lightweight cones with flat bases (suggested height 4-8 cm): 4 team props and 2 robot props. Check sliding on the actual surface.

[ ] 4 pusher packs with compatible pins/beams, two mounts, braces and short side guides; optional pre-cut card and craft tape. 4 mounting proxies and 2 mentor pushers. Keep bases assembled.

[ ] Mark two actual front mounting points; verify proxy spacing, height and wheel outline. Tape for starts and two clear floor areas covering the full swept dance path.

Rehearse on BOTH kits

[ ] Read W03_dance_Checklist.md. A left/B right, auxiliary unplugged; no sensors. Check Stop/save. Fit pusher while stopped; clear floor, wheels, cables and buttons.

[ ] Test WITH cone and pusher: repeat await drive(90), await turn(90) three times; await signal("D") outside. SPEED = 200. A wheel turn is not a heading angle. Rehearse a smaller positive turn if needed; retain turns.

[ ] Success: 3 complete drive-and-turn repeats, secure mount, cone upright inside guide. Record repeats before failure (0-3). Stop for tip/escape/loose mount; reset only when stopped.

Teach and close

[ ] Build with proxies; hand-check a gentle push and turn. Each team MUST attach and test its own pusher on the actual robot. Cone slides freely, not fastened or carried.

[ ] Use mentor pushers for early coding turns; swap to team builds for 38-50 minute retests. Change one build feature, hold dance code fixed, rerun. Preserve driver turns and minute-50 reflection.

[ ] Save four projects, label builds, count supplies and record real results in SESSION_PREP.md. Keep completed child records private.
