# Week 2 build card

## A cargo tray that keeps its load

Team ____ A ____ B ____ C ____

Build a removable tray or cradle with an edge that keeps the cube aboard.

Materials: Beams and pins or folded pre-cut card, tape, one lightweight cube, and the mounting/clearance template.

## Try it

1. Choose where the cube will sit and build a flat support.

2. Add an edge or rail without making the tray touch the floor or wheels.

3. Tilt the tray gently by hand and compare one change to its edge.

## Our jobs

Builder connects. Designer chooses parts and checks the plan. Tester hand-tests and describes the result. Everyone builds. Rotate when the mentor calls time.

## Test and improve

Cube stays in the tray during a gentle tilt; tray does not sag into a wheel.

We noticed _____. We changed _____.

A mentor supplies an example tray for the first robot turn. Keep payload and tray unchanged during each distance comparison; test the team tray during the retest.

Fit only to a stopped robot after the mentor checks clearance. Leave wheels, buttons, cables and sensors clear.
