Week 4 build card

A garage with a dependable target wall

Team ____ A ____ B ____ C ____

Build a stable garage entrance and a broad, flat back wall that the distance sensor can face.

Materials: Pre-cut cardboard, tape or spare bricks, ruler and a small wheeled proxy or footprint template.

Try it

1. Make a bay wider than the base footprint.

2. Brace the flat back wall so a light tap does not tip it over.

3. Move the unpowered proxy through the entrance. Mark a stopping zone in front of the wall.

Our jobs

Builder connects. Designer chooses parts and checks the plan. Tester hand-tests and describes the result. Everyone builds. Rotate when the mentor calls time.

Test and improve

Proxy clears the entrance; target wall stays flat and upright at sensor height.

We noticed _____. We changed _____.

Use the mentor wall during initial parking tests. The mentor approves the team garage before its robot retest; keep the broad wall and sensor line of sight clear.

Fit only to a stopped robot after the mentor checks clearance. Leave wheels, buttons, cables and sensors clear.
