# Delivery to a target

A variable controls travel

# Today’s robot challenge

A consistent taped start

Three measured trials

One value changed at a time

**GREEN steady: on** **ORANGE flashing: charge** **RED flashing: stop + mentor**

Center button lights. A letter on the display is your program’s output.

# Variables and a fair test

```
travel = 180
await drive(travel)
await signal("D")
```

## Our prediction

If 180 wheel degrees travels 9 cm, what might 360 do?

What will you keep the same in your test?

Reading fragment from the complete supplied project

# Our robot and build jobs

Driver edits and starts after “clear.”

Navigator predicts and resets the stopped robot.

Observer watches, measures and records.

Other team builds. Everyone rotates jobs.

Robot turns: rotate every 4 minutes. Retests: every 2 minutes.

# Evidence from our test

We changed _____.

We predicted _____.

We observed _____.

Our next test would _____.

# What we learned and noticed

What did you learn about reaching a target?

What did you observe in your distance tests?

What would you change in your tray or next run?

Save your team project. Store your build. Reset the robot and parts.
