A rescue attachment

A small mechanical change improves delivery

Today’s robot challenge

A sketch and a removable plow

Two tests with one design change

An explanation of your deliver function

GREEN steady: on **ORANGE flashing: charge** **RED flashing: stop + mentor**

Center button lights. A letter on the display is your program’s output.

Engineering design and reusable functions

```
async def deliver():
    await signal("R")
    result = await seek_marker(threshold)
    print(result)

# inside student_recipe
await deliver()
```

Our prediction

How could side guides change the cube’s path?

What stays unchanged when you compare designs?

Reading fragment from the complete supplied project

Our robot and build jobs

Driver edits and starts after “clear.”

Navigator predicts and resets the stopped robot.

Observer watches, measures and records.

Other team builds. Everyone rotates jobs.

Robot turns: rotate every 4 minutes. Retests: every 2 minutes.

Evidence from our test

We changed _____.

We predicted _____.

We observed _____.

Our next test would _____.

What we learned and noticed

What did you learn while building your guide?

What did you observe when it moved the cube?

What would you change in the guide or program?

Save your team project. Store your build. Reset the robot and parts.
